1.0 INTRODUCTION

C.F. Crozier & Associates Inc. (Crozier) has been retained by LIV (Hawk Ridge) LP (LIV Communities) to complete a Floodplain Report in support of an Official Plan Amendment (OPA), Zoning By-Law Amendment (ZBA) and Draft Plan of Subdivision Application for the proposed development located at 1151 Hurlwood Lane in the Township of Severn (Township), County of Simcoe (County). The proposed development will herein be referred to as the Subject Development/Subject Lands.

The Subject Lands are approximately 126 ha and are bounded by agricultural lands and open space to the north, Burnside Line to the east, the proposed Inch Farm Development Lands and Highway 11 to the south, and Uthoff Line to the west. The municipal boundary between the Township of Severn and City of Orillia is located west of the site, along Highway 11. Approximately 26 ha of the Subject Lands are proposed for re-development. Refer to **Figure 1** for the Site Location Plan.

The Concept Plan for the Subject Development was prepared by Biglieri Group (August 2024) and has been included as **Figure 2**. The elements envisioned within the Concept Plan include a mix of low density single detached units (290) and medium density townhouse units (560) for a total of 850 units. The Concept Plan also includes two (2) stormwater management blocks, a series of municipal infrastructure blocks to support sanitary and water servicing, and 20 m right-of-way allowances and parkland/natural heritage area.

This report has been prepared to establish a Regulatory Floodline on the Subject Lands in support of establishing development constraints.

2.0 SITE DESCRIPTION

The Subject Lands are characterized by golf course features including tee decks, bunkers, and offline irrigation ponds.

The Subject Development is located within the Silver Creek Watershed Area, which drains to the North River and then ultimately, the Georgian Bay. The Silver Creek bisects the Subject Development and flows from the south to the north, consistent with the general topography of the Subject Development. The watercourse is gently winding and contained in a shallow well-defined channel.

The Subject Lands can be described as a shallow valley. The on-site soils are classified as a mixture of Alliston Sandy Loam, Grandby Sandy Loam and Guerin Loam which are classified as Hydrologic Soil Groups B, C, and B respectively (OMAFRA, 2019).

3.0 EXISTING FLOODPLAIN MODELLING

3.1 Topographic Data

Three sources of topographic data were used as part of the floodplain analysis:

LiDAR topographic info obtained from Equator Studios (January 2023) was used to identify the catchments contributing to the Silver Creek for the hydraulic model discussed in Section 3.2.

Within the Subject Lands itself, topographic survey was completed by Rudy Mak Surveying Ltd. (November 2023) This data was used in the hydraulic model discussed in Section 3.3. Furthermore, a second LiDAR topographic data source was acquired from First Base Mapping Solutions (December 2023) to supplement the topographic survey immediately around the Subject Lands.

3.2 Hydrologic Model & Flow Rates

As no hydrological model of the Silver Creek was available, it was necessary to prepare a hydrological model of the Silver Creek to establish flow rates throughout the Subject Lands.

The hydraulic modeling of the Silver Creek was prepared extending from the two southernmost tributaries at the upstream end of the watercourse to the north end of the site where the watercourse exits the Subject Lands.

The total contributing watershed was separated into five (5) sub-catchments. Catchments 1, 2 and 3 were identified and delineated using topographic data, whereas Catchments 4 and 5 were identified as being part of the Silver Creek Basin in the City of Orillia Comprehensive Stormwater Management Master Plan, this figure has been provided in **Appendix B**. Please refer to **Figure 3 – Watershed Delineation** for the identified catchments within the Silver Creek Watershed.

Land use for all catchments was identified using satellite imagery. Soil types were obtained from the Ontario Soil Survey Complex. The following is a description of the catchments:

Catchment Pre-1: This catchment consists of the north and northwestern portion of the site as well as external lands to the west of Uhthoff Line. This catchment is approximately 160 ha and is generally rural.

Catchment Pre-2: This catchment consists of the lands to the west of the site which enter the Subject Lands through a culvert on Uhthoff Line. This catchment is approximately 150 ha and features significant impervious area due to the presents of an aggregate quarry.

Catchment Pre-3: This catchment consists of the south and southwestern portion of the site as well as external lands to the west of Uhthoff Line. This catchment is approximately 220 ha and is generally rural.

Catchment Pre-4: This catchment consists of the lands to the south of the site in the City of Orillia. This catchment is approximately 260 ha and features residential subdivisions / roads and parking areas.

Catchment Pre-5: This catchment consists of the lands to the south of the site in the City of Orillia. This catchment is approximately 200 ha and features residential subdivisions / roads and parking areas.

Once the contributing watershed was delineated, a hydrologic model was prepared using Visual OTTHYMO Version 6.1.

With the aforementioned data collected, the Curve Number (CN) and Impervious cover values for the watershed could be established. Time of concentration was calculated using the Airport Method. Refer to **Appendix A** for the hydrologic parameter sheets. Refer to **Appendix B** for the Silver Creek Hydrologic Model Output.

Based on the results of the hydrologic modelling it was determined that the 100-year - 24-hour SCS flow rate governs the peak flow rate in the Silver Creek throughout the development area. As such, the SCS distribution values were applied to the hydraulic model.

The peak flows for the main contributing reaches of the Silver Creek have been summarized below in **Table 1**.

Table 1: Summary of Catchment Information and Flow Rates

Location	Flow (m ³ /s) (100-year SCS)	Flow (m ³ /s) (Regional)
Silver Creek North	73.51	52.44
Silver Creek Southwest	16.9	10.5
Silver Creek Southeast	58.8	42.2

The peak flow rates presented in **Table 1** represent the flow rates used in the hydraulic model presented in Section 3.3.

3.3 Hydraulic Model Setup

Floodplain analysis for the Subject Lands was performed using U.S. Army Corps' HEC-RAS hydraulic computer model, Version 6.4.1. The purpose of the analysis is to establish the existing Regulatory floodline across the site based on topographic survey of the Subject Lands.

As previously stated, the Silver Creek enters the site from the south and the southwest and flows in a northerly direction where it exits the subject lands to the north. A topographic survey (Rudy Mak Surveying Ltd., 2023) was used to establish the culvert inverts and channel/riverbank elevations. Further site visits were conducted in order to assess the state of the golf course crossings that exist throughout the site as well as the general flow characteristics of the creek.

Twenty-Nine (29) cross sections with three (3) additional bridge crossing sections were extended across the Subject Lands. Several other crossings were identified throughout the watercourse, however due to the temporary nature of several of these crossings, they were not modelled as they would have negligible impact on conveyance. Please Refer to **Figure 4** for the Bridge Location Assessment.

Based on observation during site reconnaissance, Manning's roughness values were selected at 0.035 for the main channel which reflects natural watercourse with some weeds and heavy brush on the banks; while the overbank areas were selected to be either 0.045 or 0.070 which reflects areas with light to medium brush and trees and areas of medium to dense brush and trees respectively. Please refer to **Figure 5** for the Manning's n Location Plan.

A subcritical flow regime was modelled to conservatively estimate the hydraulic profile. The downstream boundary condition was set at normal depth with an energy slope of 0.003 m/m.

3.4 Downstream Boundary Conditions & Flow Regime

To accurately capture any downstream impacts of the Silver Creek on the Subject Lands, a "Normal Depth" boundary condition with the friction slope matching the energy grade line of 0.003 m/m was set. This value was estimated by measuring the slope of the stream bed of the entire watercourse.

A subcritical flow regime was modelled to conservatively estimate the hydraulic profile. Preliminary checks of the Froude Number were completed to ensure that it was less than 1, which confirms that a subcritical flow regime is adequate to model the watercourse.

3.5 Crossing Inventory

Based on a site walk completed on November 11, 2023, several types of crossings were identified within the site. These crossings were grouped into three (3) distinct categories which determined how they were modelled.

Type 1 crossings are described as having minimal surface area and are temporary in nature, therefore these crossings have not been included in the hydraulic model. Type 2 Crossings are characterized by having minimal surface area while still being permanent structures, these crossings lacked embankments on either side. Type 2 crossings have been included in the hydraulic model as lids. Type 3 crossings are characterized as being permanent and having significant surface area against the watercourse. Type 3 crossings have been modelled as typical road crossings or bridges.

To further validate the bridge modelling methodology, the cross-sectional area of each modelled crossing was compared to measurements taken during site visits to ensure that the HEC-RAS modelling reflects the on-site conditions.

Refer to **Appendix C** for an overview of crossings located within the Subject Lands, as well as a cross-sectional area comparison.

3.6 Results

Results from the existing condition hydraulic analysis of the Silver Creek are presented in **Table 2** and the extent of the 100-year floodplain has been illustrated on **Figure 6**. Refer to **Appendix D** for the detailed HEC-RAS outputs.

Table 2: Existing Conditions Regional Water Surface Elevations

280.82	229.93	
279	229.73	
221.41	229.62	

As shown in **Figure 5**, the floodplain limit at the majority of the floodplain is contained to the center of the Subject Lands.

4.0 SENSITIVITY ANALYSIS

A sensitivity analysis was completed to assess the impact of variation in modelling parameters including channel and overbank roughness coefficients, increased flows, and expansion and contraction coefficients. The results of these analyses were used to confirm the validity of the prepared pre-development floodplain model.

Channel and Overbank Roughness Coefficients

For this portion of the sensitivity analysis the Manning's n value for both the main channel, as well as the overbank were increased. The values used in the sensitivity analysis were based on the acceptable range of Manning's n roughness coefficient values for types of land cover present on site. **Table 3** below shows the original Manning's n values as well as the increased value.

Table 3: Original vs. Increased Manning's n

Description	Original Run Manning's n	Sensitivity Run Manning's n	Percent Increase
Main Channel	0.035	0.04	14%
Light / Medium Brush	0.045	0.05	11%
Medium / Dense Treed	0.07	0.075	7%

This increase in the Manning'n roughness coefficient led to an increase in water surface elevations ranging from 0.03 m to 0.12 m with an increased average of 0.05 m across the Subject Lands. Consequently, the overall inundated area expanded by approximately 8%. The resulting change would not significantly impact the developable limits as shown in **Figure 6**.

Increased Flows

For this portion of the analysis, the flows from the governing storm event (100-year 24-hour SCS) were increased by 15%. See **Table 4** below for the summary of these flows.

Table 4: Summary of Catchment Information and Flow Rates

Location	Flow (m ³ /s) (100-year SCS)	Flow (m ³ /s) (100-year SCS + 15%)
Silver Creek North	73.5	84.5
Silver Creek Southwest	16.9	19.4
Silver Creek Southeast	58.8	67.6

These increased flows contributed to an average increase of 0.08 m to the water surface elevations with a maximum increase of 0.13 m and a minimum of 0.03 m. The increased flows also led to an increase in inundation area of around 13%.

As expected, the floodplain did increase with increased flows, the increased floodplain does not encroach on the developed area of the site and is contained primarily to the northern, downstream end of the site.

Further investigation of appropriate freeboard measures will be conducted to ensure adequate floodproofing is provided for the development.

Expansion & Contraction Coefficients

For this portion of the sensitivity analysis, the expansion and contraction coefficients for all cross sections has been increased by 20% from the typical values as outlined in the HEC-RAS Hydraulic Reference Manual.

Results from this analysis yielded insignificant changes in water surface elevations across the site and a negligible change in the inundated area.

This analysis confirms that the model is not sensitive to changes in the expansion & contraction coefficients.

Sensitivity Analysis Summary

As a result of the sensitivity analysis, it can be concluded that there are impacts to floodplain elevation across the Subject Lands through the alteration of floodplain peak flows, as well as channel and overbank roughness coefficients. The observed changes did not exceed 0.15 m and therefore the typical 0.3 m of floodplain freeboard to the proposed grades of the development area is sufficient to withstand minor variance in hydrologic and hydraulic parameters. A summary of the outputs from each of the sensitivity runs can be found in **Appendix E**.

5.0 PRELIMINARY CROSSING SIZING

A new watercourse crossing is proposed to be installed to support the development road network. The crossing will be open bottom to protect fish habitat and sized to minimize upstream flooding. The preliminary crossing design indicates that a 9.75 m wide span bridge will be sufficient to convey design flows. A summary of culvert statistics is shown in **Table 5**. The proposed culvert location is shown on **Figure 7**.

Table 5: Proposed Culvert Summary

Tributary	Span (m)	Proposed Culvert Size (H x L)	Proposed Culvert Slope (m)
Silver Creek South	9.75	1.8 m x 20.0 m	1.8%

Floodplain elevations are increased immediately upstream of the proposed crossing due to flow restriction associated with the culvert installation, however these floodplain elevation increases are localized and do not extend beyond the limit of the Subject Lands. The development will be graded such that a minimum vertical freeboard of 0.3 m is provided from the proposed Regulatory floodplain elevation to the development limit.

6.0 FLOODPLAIN REGULARIZATION

A wide and shallow floodplain condition occurs on the west side of Silver Creek North floodplain. This portion of the floodplain was targeted as a location for potential floodplain regularization. An assessment of the existing floodplain storage within the targeted regularization area was conducted in 0.3 m vertical increments to establish the target floodplain storage to be provided under proposed conditions.

Fill was proposed to raise a portion of the area out of the floodplain and a corresponding cut volume was proposed to offset the fill within the 100 Year (Regulatory) floodplain. The floodplain storage was successfully balanced between existing and proposed conditions and resulted in a net increase in floodplain storage of approximately 70 m³. The resulting floodplain is shown on **Figure 8**, preliminary grading is shown on **Figure 9**, and the supporting calculations are included in **Appendix F** and summarized in **Table 6** below.

Table 6: Proposed Floodplain Storage Balancing

Increment Elevation Range	Incremental Cut Volume (m ³)	Incremental Fill Volume (m ³)	Proposed Additional Floodplain Storage Volume (m ³)
226.68 - 226.98	0.0	0.0	0.0
226.98 - 227.28	0.2	5.1	-4.9
227.28 - 227.58	115.9	106.2	9.7
227.58 - 227.89	839.7	868.2	-28.5
227.89 - 228.20	634.5	536.1	98.4
228.20 - 228.50	112.9	115.9	-3.0
228.50 - 228.80	0	2.3	-2.3
Net Increase in Floodplain Storage			69.4

An additional floodplain modelling scenario was generated in HEC-RAS to reflect the proposed floodplain regularization. Resultant floodplain elevations were compared to the existing floodplain elevations and there was no notable impact associated with the proposed regularization earthworks.

7.0 CONCLUSIONS

Based on the foregoing we conclude the following:

- The existing 100-year event governs the floodline within the Subject Lands.
- The main flood flows from the south and southwest branches flow into the site from Uthhoff Line, these branches combine at Cross Section 1641.52 where they flow in northerly direction.
- A 9.75 m wide open bottom span bridge is proposed to provide connectivity within the Subject Lands. The floodplain elevation increases associated with the proposed crossing are localized and do not extend beyond the limit of the Subject Lands.
- Floodplain regularization is proposed on the west side of the Silver Creek North floodplain resulting in a net increase of floodplain storage of approximately 70 m³.

Given the above noted conclusions, the proposed development as shown on the proposed Concept Plan is supportable with respect to flood and erosion hazards.

APPENDIX C

Crossing Inventory

Project No.: 1935-6133-3

Date: 2024-01-10

Completed by: TM

Checked by: BH

Hawk Ridge Formal Floodplain Analysis Crossing Inventory

Crossing 1

Description

Crossing 1 is a approximately 4m wide 0.5m thick golf cart bridge traversing the low flow channel. Due to the minimal surface area the crossing will have on flow conveyance and lack of embankments on either side of the crossing, Crossing 1 was modeled as a Lid.5

Project No.: 1935-6133-3

Date: 2024-01-10

Completed by: TM

Checked by: BH

Hawk Ridge Formal Floodplain Analysis Crossing Inventory

Crossing 2

Description

Crossing 2 is a approximately 4m wide 0.7m thick golf cart bridge traversing the low flow channel. Due to the minimal surface area the crossing will have on flow conveyance and lack of embankments on either side of the crossing, Crossing 2 was modeled as a Lid.

Project No.: 1935-6133-3

Date: 2024-01-10

Completed by: TM

Checked by: BH

Hawk Ridge Formal Floodplain Analysis Crossing Inventory

Crossing 3

Description

Crossing 3 is a approximately 4m wide 0.7m thick golf cart bridge traversing the low flow channel. Due to the minimal surface area the crossing will have on flow conveyance and lack of embankments on either side of the crossing, Crossing 3 was modeled as a Lid.

Project No.: 1935-6133-3

Date: 2024-01-10

Completed by: TM

Checked by: BH

Hawk Ridge Formal Floodplain Analysis Crossing Inventory

Crossing 4

Description

Crossing 4 is approximately 8m wide and 2.5m thick golf cart bridge traversing the low flow channel. Due to this crossing having a significant surface area with the channel, it is deemed that a 4 cross section bridge method was required to adequately model this feature.

Project No.: 1935-6133-3

Date: 2024-01-10

Completed by: TM

Checked by: BH

Hawk Ridge Formal Floodplain Analysis Crossing Inventory

Culvert 1

Description

Culvert 1 is approximately 5m long and is 1m in diameter. Since this crossing restricts the entirety of the watercourse this feature was deemed to have significant impact on the floodplain and therefor was modeled as a 4 cross section bridge complete with ineffective flow areas as well as expansion and contraction coefficients. Culvert 1 and Culvert 2 were moddled within the same 4 cross sections as it was deemed that the floodplains between the Silver Creek Southeast Reach and the South West Reach overlapped.

Project No.: 1935-6133-3

Date: 2024-01-10

Completed by: TM

Checked by: BH

Hawk Ridge Formal Floodplain Analysis Crossing Inventory

Culvert 2

Description

Culvert 2 is approximately 7m long and is 1m in diameter. Since this crossing restricts the entirety of the watercourse this feature was deemed to have significant impact on the floodplain and therefor was modeled as a 4 cross section bridge complete with ineffective flow areas as well as expansion and contraction coefficients. Culvert 1 and Culvert 2 were moddled within the same 4 cross sections as it was deemed that the floodplains between the Silver Creek Southeast Reach and the South West Reach overlapped.

Project No.: 1935-6133-3

Date: 2024-01-10

Completed by: TM

Checked by: BH

Hawk Ridge Formal Floodplain Analysis Crossing Inventory

Crossing 5

Description

Crossing 5 is a approximately 3.5m wide 0.3m thick golf cart bridge traversing the low flow channel. Due to the minimal surface area the crossing will have on flow conveyance and lack of embankments on either side of the crossing, Crossing 5 was modeled as a Lid.5

Project No.: 1935-6133-3

Date: 2024-01-10

Completed by: TM

Checked by: BH

Hawk Ridge Formal Floodplain Analysis Crossing Inventory

Crossing 6

Description

Crossing 6 is a approximately 3.5m wide 0.3m thick golf cart bridge traversing the low flow channel. Due to the minimal surface area the crossing will have on flow conveyance and lack of embankments on either side of the crossing, Crossing 6 was modeled as a Lid.

Crossing 7

Description

Crossing 7 is a approximately 3.5m wide 0.3m thick golf cart bridge traversing the low flow channel. Due to the minimal surface area the crossing will have on flow conveyance and lack of embankments on either side of the crossing, Crossing 7 was modeled as a Lid.

Project No.: 1935-6133-3

Date: 2024-01-10

Completed by: TM

Checked by: BH

Hawk Ridge Formal Floodplain Analysis Bridge Inventory

Crossing 8

Description

Crossing 8 is approximately 8m wide and 1.5m thick golf cart bridge traversing the low flow channel. Due to this crossing having a significant surface area with the channel, it is deemed that a 4 cross section bridge method was required to adequately model this feature.

Project No.: 1935-6133-3

Date: 2024-01-10

Completed by: TM

Checked by: BH

Hawk Ridge Formal Floodplain Analysis Crossing Inventory

Crossing 9

Description

Crossing 9 is a approximately 3.5m wide 0.3m thick golf cart bridge traversing the low flow channel. Due to the minimal surface area the crossing will have on flow conveyance and lack of embankments on either side of the crossing, Crossing 9 was modeled as a Lid.

Project No.: 1935-6133-3

Date: 2024-01-10

Completed by: TM

Checked by: BH

Hawk Ridge Formal Floodplain Analysis Crossing Inventory

Crossing A

Description

Crossing A is a approximately 2m wide 0.2m thick maintenance bridge traversing the low flow channel. Due to this crossing having a minimal surface area against the water course and the temporary nature of the feature, Crossing A was not included in the model.

Project No.: 1935-6133-3

Date: 2024-01-10

Completed by: TM

Checked by: BH

Hawk Ridge Formal Floodplain Analysis Crossing Inventory

Crossing B

Description

Crossing B is a approximately .7m wide 0.2m thick maintenance bridge traversing the low flow channel. Due to this crossing having a minimal surface area against the water course and the temporary nature of the feature, Crossing B was not included in the model.

Project No.: 1935-6133-3

Date: 2024-01-10

Completed by: TM

Checked by: BH

Hawk Ridge Formal Floodplain Analysis Crossing Inventory

Crossing C

Description

Crossing C is a approximately .7m wide 0.2m thick maintenance bridge traversing the low flow channel. Due to this crossing having a minimal surface area against the water course and the temporary nature of the feature, Crossing C was not included in the model.

Project No.: 1935-6133-3

Date: 2024-01-19

Completed by: TM

Checked by: BH
